

DermaFlash SAM

Beauty comes from the inside out

Our skin, the body's largest organ, can radiate good health or suggest fatigue, stress or illness. The skin on our face makes the first impression. The impression we want to leave is that of healthy, glowing, radiant skin.

The DermaFlash SAM

provides an incredibly accurate picture of the skin's condition underneath the outer layer of skin. Using specialised UV-A fluorescent lamps, SAM illuminates a person's face causing normally invisible residue under the top layers of skin to appear in the fluorescent glow. Both the skin care professional and client are able to see the layer beneath the top layer of the skin, showing skin conditions that are not visible to the naked eye.

The importance of properly identifying problems under invisible skin layers as early as possible to prepare the right skin care treatment plan.
