

We have nothing but excellent clinical and cosmetic results using the Intraceuticals Oxygen Therapy. Initially we were using the treatments indicated by the manufacturer as a stand alone. Once we discovered its soothing and hydrating component to the skin, we began incorporating this treatment into our PhotoFacial *sm* Elite protocol.

The treatment works well post chemical peel for sun damaged skin. Its hydrating and lightening components are a compliment to the results of the chemical peel as well as post fractional resurfacing.

**Patrick H. Bitter Sr., MD , Founder Epi Center MedSpa  
Developer of the PhotoFacial Treatment Protocol**

The Intraceuticals Oxygen Infusion is truly a favorite among my patients. We are known for giving intense result-driven treatments at the Epicenter MedSpa, so I was a bit wary of bringing on a treatment that does not involve a little bit of recovery time. But this treatment is fabulous. The results are instant and longer lasting than I expected. I always do half a face and let the patient sit up to compare sides. They are always shocked at the instant lift and plumping action of their skin. This is a great stand alone treatment for dehydration and does wonders to help bring down inflammation of the skin. The Oxygen Facial works miracles to speed up the healing time and reduce sensitivity after aggressive Photofacials, Photodynamic Therapy and Fractionated Ablative Treatments. And of course this is a must-have treatment for a special event-who doesn't want to have plump, glowing skin?
